Rabiu Opeyemi

Software Engineer

Email | Linkedin | Github | 07066369927

Professional Summary

Full Stack Software Engineer with 4+ years of experience building fintech products with Java, Spring Boot, React, and Next.js. I specialize in payment and transaction systems, card platform integrations (Marqeta, Stripe, Paystack), and AI features built with Spring AI, delivering secure, reliable software end to end.

Technical Skills

- Languages: TypeScript, JavaScript, Java, SQL
- Frontend: React, Next.js, Redux Toolkit, Zustand, TanStack Query, Tailwind CSS
- Backend: Node.js, NestJS, Express.js, Spring Boot, Spring Core, Spring Ai.
- Databases: PostgreSQL, MySQL, MongoDB, Redis
- APIs & Systems: REST, GraphQL, WebSockets, Payment APIs
- Testing: Jest, React Testing Library, Playwright, JUnit, Mockito
- Cloud & DevOps: AWS, Docker, GitHub Actions, CI/CD, Vercel
- Security: JWT, OAuth, Authentication & Authorization, CORS

Experience

Duplo — Frontend Engineer

Jan 2025 – Dec 2025 | Lagos, Nigeria

- Co-developed Duplo's Merchant Dashboard, a fintech platform that enables businesses to manage vendors, initiate and track payments, approve transactions, reconcile accounts, and monitor financial operations from a centralized interface.
- Built intuitive, responsive interfaces for payment processing, transaction history, invoice management, beneficiary management, approval workflows, and financial reporting, helping businesses streamline day-to-day financial operations.
- Developed reusable React components and integrated RESTful APIs to deliver secure, scalable, and high-performance user experiences.
- Collaborated closely with product designers and backend engineers to translate business requirements into production-ready features, improving operational efficiency and reducing manual financial processes.
- Optimized application performance, resolved production issues, and maintained a clean, scalable codebase through testing and code reviews.

Vendcliq — Frontend Engineer

May 2025 – Present | Lagos, Nigeria

Vendcliq is a platform designed to help vending businesses streamline their operations, bringing inventory management, finance tracking, and vendor discovery into a single, unified experience.

- Developed responsive and user-friendly frontend interfaces for managing inventory, enabling businesses to track stock levels, restocking needs, and product availability in real time.
- Built financial management features, including wallet interfaces, revenue tracking, expense monitoring, and seamless bank transfer flows.
- Implemented a vendor marketplace that allows users to browse vendors and products, improving sourcing efficiency within the platform.
- Integrated APIs for inventory, financial data, and transactions, ensuring accurate and reliable data flow across the application.
- Focused on performance optimization and intuitive UI/UX to simplify complex business operations for end users.
- Collaborated with designers and backend engineers to deliver scalable, maintainable, and production-ready features within project timelines.

SewMyWears — Software Engineer(Contract)

2026 – Present | United Kingdom

SewMyWears is a bespoke fashion platform that enables customers to order custom-made clothing from skilled tailors through a seamless digital experience.

- Developed and maintained backend APIs using NestJS to support service requests, order processing, and customer-tailor workflows.
- Integrated Stripe to enable secure USD payments for international customers.
- Integrated Paystack to support secure NGN payments for customers in Nigeria.
- Implemented payment verification and webhook handling to ensure accurate transaction confirmation and order status updates.
- Built secure RESTful APIs and collaborated with frontend engineers to deliver reliable end-to-end payment experiences.
- Participated in code reviews, debugging, testing, and deployment of production-ready backend features.

Projects

RiskShield: Card Transaction Analytics & Explanation Platform | Java 21, Spring Boot 4, PostgreSQL, Marqeta, Spring AI, Ollama, Next.js

Built a card analytics platform on Marqeta's card-issuing sandbox that explains declines, holds, and unusual activity to cardholders in plain language, reducing the need to contact customer support. Github

- Integrated Marqeta's Core API to register cardholders, issue virtual cards, fund accounts (GPA orders), and simulate card authorizations and clearings.
- Built a secure webhook pipeline (Basic Auth, constant-time verification) that stores raw events, deduplicates by token, and supports replay, handling late, duplicate, and out-of-order deliveries.
- Modeled the full transaction lifecycle by linking authorizations to clearings, preventing double-counted spending and handling clearings that arrive before their authorization.
- Synchronized card status from webhooks using millisecond event timestamps and pessimistic row locking, fixing a real lost-update race condition between concurrent events.
- Developed behavioral analysis that builds per-user spending profiles (category medians, 90th percentiles, merchants, time-of-day patterns) and flags unusual purchases with explainable, rule-based scoring.
- Added AI explanations for declines and unusual activity with Spring AI and a local LLM (Ollama), where Java computes every fact and the model only phrases it, with a rule-based fallback when the AI is unavailable.
- Built a natural-language assistant using tool calling, with tools bound to one user server-side so the AI cannot access other users' data.
- Built a Next.js dashboard for cardholders, cards, transactions, insights, and the assistant; resolved N+1 queries with entity graphs and fetch joins.

Personal Finance App (Java, Spring-boot, React.js , Next.js ,)

Built a full-stack personal finance application that gives users complete control over their money, from virtual card management to real-time budget tracking and peer-to-peer transfers.

Key features:

- Built a full-stack financial platform supporting wallet funding, virtual cards, budgeting, peer-to-peer transfers, and transaction management.

- Developed a transaction decision engine that validates card status, CVV, expiry, spending limits, and wallet balance before authorizing transactions.
- Implemented a double-entry-style transaction ledger to maintain credit/debit history and running balances.
- Built wallet funding and real-time balance tracking workflows for financial transactions.
- Implemented budget controls that automatically update category spending when transactions are completed.
- Developed peer-to-peer transfers using unique account numbers and transaction validation.
- Built virtual card controls including freeze/unfreeze functionality and spending limits.
- Designed REST APIs and integrated the frontend with backend financial services.
